DOCUMENT 04

Results and Conclusion

Current implementation, results framework, limitations, and future scope

Project: Olympic Sports Performance Analysis

Application: Python Flask web application | **Deployment:** Render

1. Expected Project Outcomes

The project is designed to provide a single web interface for introducing Olympic sports analysis and presenting its visual outputs. When the dataset and Tableau views are connected, users should be able to explore participation, medal achievements, sports, and country-level comparisons.

2. What the Current Build Demonstrates

- A Flask application with three routes: Home, Dashboard, and Story.
- A landing page customised with Olympic Analytics project content.
- Separate HTML templates for the dashboard and story pages.
- Static CSS, JavaScript, and image assets organised under the Flask static directory.
- A deployment-ready structure intended to run with Python and Flask on a hosting platform such as Render.

3. Results Reporting Framework

After the final dataset and Tableau workbook are connected, report the actual findings here. Useful result statements should include the measure, time period, grouping, and any relevant filter.

Result area	What to report
Participation	Actual athlete or participation counts and the years covered.
Medals	Actual gold, silver, bronze, and total medal counts.
Country comparison	Countries compared and the metric used.
Sport comparison	Sports included and the observed distribution.
Trends	Changes across years, with the selected time range stated.

4. Limitations

The supplied project ZIP does not include the underlying Olympic dataset or a completed Tableau workbook. The Dashboard and Story templates currently contain placeholder Tableau URLs. Consequently, this documentation

does not claim specific medal totals, top-performing countries, trends, or statistical conclusions.

Analysis quality will depend on the selected dataset, its coverage, cleaning decisions, and the correct configuration of published Tableau views. Historical country and event definitions may also affect comparisons.

5. Future Enhancements

- Connect the final cleaned Olympic dataset and document its source.
- Create and publish the Tableau dashboard and story.
- Replace the placeholder embed URLs in the Flask templates.
- Add dataset download or methodology information if appropriate.
- Improve accessibility, mobile layout, and page-level error handling.
- Add automated checks to verify that key chart totals match the data.

6. Conclusion

Olympic Sports Performance Analysis provides the foundation for a web-based sports analytics presentation. The Flask application organises the project into Home, Dashboard, and Story sections, while the prepared Tableau integration offers a route to interactive visual exploration. The next essential step is to connect the verified Olympic dataset, complete the Tableau views, and replace the placeholder embed links. Once those steps are completed and tested, the project can communicate evidence-based findings about Olympic participation and performance.

Documentation note: This document describes the project files supplied for review. The supplied ZIP does not include the source Olympic dataset or completed Tableau workbook. Therefore, no medal totals, rankings, chart values, or statistical findings are invented here. Update the relevant sections after connecting the final dataset and publishing the Tableau views.
